

Touch Screen DVR and CCTV Distributed Video System – Innovative Solutions Added to Porta Systems Security Product Line

Syosset, NY (August 18, 2009) - Porta Systems Corp. (OTCBB:PORT) a leader in protection and connection products for the worldwide telecommunications and security markets, announces two new additions to its security product line:

Touch Screen DVR

The Touch1600 17" all-in-one touch screen DVR was designed to provide security professionals with a user friendly, flexible and feature-rich hybrid analog/IP DVR solution. The system supports 16 video and 4 audio input channels, network connectivity (internet access to your analog cameras), on screen touch PTZ control, unlimited custom user profiles, dual event logging, alerting systems, camera motion detection, object movement detection, mosaic/privacy zones, access control integration, text insertion and people counting facility are some of the Touch1600 DVR's features.

CCTV Distributed Video System

Porta Systems CCTV Distributed Video System is a unique patent-pending balun design that transmits up to four independent CCTV video signals over a single four pair CAT5 or better UTP cable. The PS-211-DVB4 Distributed Video System is a set of four CCTV video baluns that allow cameras to be "daisy chained" together. The System gives an edge to security installers by providing a smart streamlined installation with a single cable run from one camera to another and then back to the head-end. Standard active or passive baluns are required at the head-end to complete the system.

"The Touch Screen DVR and CCTV Distributed Video System extends our strategy of providing a broad range of security products dedicated to improving the economics and reliability of a CCTV video surveillance system." said Ralph DePascale, Vice President of Sales and Marketing. "Both of these products deliver improved performance and ease of use while ensuring critical protection and flexibility of your CCTV system."
